ФУНКЦИОНАЛЬНЫЙ АНАЛИЗ

ЗАДАНИЯ
ДЛЯ СТУДЕНТОВ 3 КУРСА
МАТЕМАТИЧЕСКОГО ФАКУЛЬТЕТА

Уфа 2007

УДК 517.5

Печатается по решению кафедры теории функций и функционального анализа

Составители: Башмаков Р.А., Галимов И.С.

Задания по дисциплине „Функциональный анализ“ составлены для студентов 3 курса специальностей „Математика“ и „Прикладная математика“.

Пособие содержит контрольные вопросы и задачи, часть которых решается в аудитории на практических и лабораторных занятиях, а часть отводится для самостоятельной работы и домашних заданий.

1. АЛГЕБРА МНОЖЕСТВ

КОНТРОЛЬНЫЕ ВОПРОСЫ

1. Дать определение полукольца, кольца, σ -кольца, σ -алгебры.
2. Как определяется минимальное кольцо над множеством?
3. Как определяется полукольцо ячеек (брусьев)?

ЗАДАЧИ

1. Верно ли, что счетное
 - a) объединение,
 - b) пересечениеоткрытых множеств в $\mathbb{R}^n$ есть множество открытое?
2. Верно ли, что счетное
 - a) объединение,
 - b) пересечениезамкнутых множеств в $\mathbb{R}^n$ есть множество замкнутое?
3. Пусть X - трехэлементное множество. Постройте примеры всевозможных систем множеств из X , образующих
 - a) полукольцо;
 - b) кольцо;
 - c) алгебру.
4. Привести примеры
 - a) полукольца, не являющегося кольцом;
 - b) кольца, не являющегося алгеброй;
 - c) кольца, не являющегося σ -кольцом;
 - d) σ -кольца, не являющегося алгеброй.

5. Покажите, что система множеств, замкнутая относительно операций объединения и пересечения не обязательно является кольцом.

12. Привести пример конечно-аддитивной, но не σ -аддитивной меры.

13. Рассмотрим полукольцо $\mathcal{S}$, состоящее из полуинтервалов вида $[a, b)$.

а) Пусть F - неубывающая функция на $\mathbb{R}$ и $F(0) = 0$. Доказать, что формула $\mu_F([a, b)) = F(b) - F(a)$ определяет меру на $\mathcal{S}$.

б) Пусть μ - мера на полукольце $\mathcal{S}$. Доказать, что функция

$$F_\mu(t) = \begin{cases} \mu([0, t)), & \text{при } t > 0, \\ 0, & \text{при } t = 0, \\ -\mu([t, 0)), & \text{при } t < 0, \end{cases}$$

является неубывающей.

с) Доказать, что для того, чтобы мера μ на $\mathcal{S}$ была счетно-аддитивной, необходимо и достаточно, чтобы соответствующая функция F на $\mathbb{R}$ была непрерывна слева, т.е.

$$F(t) - F(t - 0) = \lim_{r \rightarrow 0} \mu([t - r, t)) = 0.$$

Замечание. Если $F(t) = t$, то μ_F на $\mathcal{S}$ совпадает с обычной длиной, а ее продолжение есть мера Лебега.

3  Question:  $g$  continuous,  $f$  Lebesgue measurable – is  $f \circ g$ 
4   $\hookrightarrow$  measurable?
5  Answer: NOT necessarily (Cantor function counterexample).
6
7  However,  $f \circ g$  IS measurable when  $f$  is BOREL measurable (not
8   $\hookrightarrow$  just Lebesgue).
9  The distinction: continuous functions preserve Borel sets
10  $\hookrightarrow$  but may map
11 Borel sets to non-Borel Lebesgue-measurable sets.
12
13 We formalize the positive case: Borel measurable  $\circ$ 
14  $\hookrightarrow$  continuous = measurable.
15 The failure for Lebesgue measurability requires the Cantor
16  $\hookrightarrow$  function
17 (a concrete construction not formalized here).

4. ИНТЕГРАЛ ЛЕБЕГА

КОНТРОЛЬНЫЕ ВОПРОСЫ

- Дать определение простой функции.
- Дать определение интеграла Лебега.
- Сравнить интегралы Римана и Лебега.

ЗАДАЧИ

1. Вычислить интеграл по мере Лебега от функции

a) $f(x) = e^{-[x]}$ по отрезку $[0, +\infty]$;

b) $f(x) = \frac{1}{[x+1][x+2]}$ по отрезку $[0, +\infty]$;

c) $f(x) = \begin{cases} \sin x, & \text{при } x \in \mathbb{Q}, \\ \cos x, & \text{при } x \notin \mathbb{Q} \end{cases}$ по отрезку $[0, \frac{\pi}{2}]$;

d) $f(x) = \begin{cases} \sin x, & \text{если } \cos x \in \mathbb{Q}, \\ \sin^2 x, & \text{если } \cos x \notin \mathbb{Q} \end{cases}$ по отрезку $[0, \frac{\pi}{2}]$;

e) $h(x, y) = \begin{cases} 1, & \text{если } x \cdot y \notin \mathbb{Q}, \\ 0, & \text{если } x \cdot y \in \mathbb{Q} \end{cases}$ по квадрату $[0, 1] \times [0, 1]$.

2. Пусть функция $f(x)$ ограничена и измерима по Лебегу на множестве E конечной меры, т.е. $\mu(E) < +\infty$, $A \leq f(x) \leq B \forall x \in E$. Разобьём отрезок $[A, B]$ точками $y_0 = A, y_1, y_2, \dots, y_n = B$. Обозначим через $d(y) = \max_{1 \leq k \leq n} |y_k - y_{k-1}|$ параметр разбиения. Рассмотрим множества $E_k = E(y_{k-1} \leq f < y_k)$. Выберем произвольные точки $\eta_k \in [y_{k-1}, y_k), k = 1, 2, \dots, n$. Доказать, что при приведённых выше условиях суммируемость функции $f(x)$ на E по Лебегу равносильна существованию предела

$$F(f) \stackrel{\text{def}}{=} \lim_{d(y) \rightarrow 0} \sum_{k=1}^n \eta_k \cdot \mu(E_k).$$

При этом интеграл Лебега $\int_E f d\mu$ может быть вычислен по формуле: $\int_E f d\mu = F(f)$.

2. Вычислить полную вариацию функции $f(x) = x^2$:

а) на $[0, 1]$,

б) на $[-1, 1]$.

3. Вычислить полную вариацию функции

$$\Phi(x) = \begin{cases} 0, & \text{при } x = 0, \\ 1 - x, & \text{при } 0 < x < 1, \\ 5, & \text{при } x = 1 \end{cases}$$

на отрезке $[0, 1]$.

4. а) Чему равна полная вариация функции

$$\Phi(x) = \begin{cases} x - 1, & \text{при } x < 1, \\ 10, & \text{при } x = 1, \\ x^2, & \text{при } x > 1 \end{cases}$$

на отрезке $[0, 2]$?

б) Если изменить значение $\Phi(x)$ в точке разрыва $x = 1$, то вариация функции изменится. Как изменить значение этой функции в точке $x = 1$, чтобы вариация стала наименьшей?

5. Доказать, что функция:

$$a) \Phi(x) = \begin{cases} 0, & \text{при } x = 0, \\ x^2 \cos \frac{\pi}{x}, & \text{при } x \neq 0 \end{cases}$$

имеет ограниченную вариацию на отрезке $[0, 1]$;

$$b) \Phi(x) = \begin{cases} 0, & \text{при } x = 0, \\ x^2 \sin \frac{1}{x}, & \text{при } x \neq 0 \end{cases}$$

имеет неограниченную вариацию на отрезке $[0, \frac{2}{\pi}]$.

Формализация на Lean 4

```

1  /-
2  Section 5, Task 05.
3  (a)  $x^2 \cos(\pi/x)$  has bounded variation on  $[0, 1]$ .
4  Proof:  $f'$  bounded  $\square$  Lipschitz  $\square$  BV.
5  (b)  $x^2 \sin(1/x)$  has bounded variation on  $[0, 2/\pi]$ .
6  Proof:  $f'(x) = 2x \sin(1/x) - \cos(1/x)$  is bounded ( $|f'| \leq$ 
7   $\hookrightarrow 3$ ),
8  so  $f$  is Lipschitz hence BV – same principle as (a).
9
10 Note: The original task description claimed "unbounded
11  $\hookrightarrow$  variation",
12 but this is incorrect:  $|f'(x)| \leq 2|x|+1 \leq 2(2/\pi)+1 < 3$ ,
13 so  $f$  is Lipschitz on  $[0, 2/\pi]$  and thus has bounded
14  $\hookrightarrow$  variation.
15
16 We formalize two principles:
17 (a) Lipschitz  $\square$  locally BV.
18 (b) Differentiable with bounded derivative on convex set  $\square$ 
19  $\hookrightarrow$  Lipschitz  $\square$  BV.
20 This is the key fact for  $x^2 \sin(1/x)$ : its derivative is
21  $\hookrightarrow$  bounded.
22

6. Вычислить интеграл $\int_{-1}^3 x d\Phi(x)$, где

$$\Phi(x) = \begin{cases} 0, & \text{при } x = -1, \\ 1, & \text{при } x \in (-1, 2), \\ -1, & \text{при } x \in [2, 3]. \end{cases}$$

7. Пусть $\Phi(x) \in C^{(1)}[a, b]$. Доказать, что

$$\int_a^b f(x) d\Phi(x) = \int_a^b f(x) \Phi'(x) dx.$$

Формализация на Lean 4

```

1  /-
2  Section 5, Task 7.
3  If  $\Phi \in C^1[a, b]$ , then  $\int f d\Phi = \int f \cdot \Phi' dx$  (RS integral = Riemann
    $\hookrightarrow$  integral).
4
5  The key connection: for a  $C^1$  monotone  $\Phi$  with derivative  $\Phi'$ ,
    $\hookrightarrow$  the Stieltjes
6  measure of  $(a, b]$  is the integral of  $\Phi'$ :
7   $\mu_\Phi((a, b]) = \Phi(b) - \Phi(a) = \int_a^b \Phi'(x) dx$ .
8  The first equality is the Stieltjes measure definition; the
    $\hookrightarrow$  second is FTC.
9  This shows the Stieltjes integral  $\int f d\mu_\Phi$  reduces to
    $\hookrightarrow$  ordinary integration
10 against the density  $\Phi'$ .
11 -/

1  /-
2  Section 5, Task 10.
3  The RS integral of a continuous function does not depend on
4  ↪ the
5  values of the integrator  $\Phi$  at finitely many interior points.
6
7  In the Stieltjes framework, this is automatic: a
8  ↪ StieltjesFunction
9  is right-continuous, so its measure  $\mu_\Phi((a, b]) = \Phi(b) - \Phi(a)$ 
10 ↪ depends
11 only on  $\Phi$ 's values, which equal its right limits. The
12 ↪ integral
13  $\int f d\mu_\Phi$  is determined by the measure, hence by right limits
14 ↪ of  $\Phi$ .
15
16 Concretely: modifying  $f$  at a finite (hence null) set doesn't
17 ↪ change
18 the integral w.r.t. any atomless measure. For a continuous
19 ↪ integrator  $\Phi$ ,
20  $\mu_\Phi$  has no atoms ( $\mu_\Phi(\{c\}) = \Phi(c) - \Phi(c-) = 0$ ), so finite
21 ↪ sets are null.

11. Пусть функция $f(x)$ непрерывна на отрезке $[a, b]$, а функция $\Phi(x)$ имеет на $[a, b]$ всюду, кроме конечного числа точек $c_1, \dots, c_k$, суммируемую по Риману производную $\Phi'(x)$. Доказать, что при этих условиях существует интеграл Римана-Стилтьеса $\int_a^b f d\Phi$, и что он выражается формулой

$$\begin{aligned} \int_a^b f d\Phi &= \int_a^b f(x)\Phi'(x) dx + f(a) \cdot [\Phi(a+0) - \Phi(a)] \\ &\quad + f(b) \cdot [\Phi(b) - \Phi(b-0)] + \sum_{m=1}^k f(c_m) \cdot [\Phi(c_m+0) - \Phi(c_m-0)]. \end{aligned}$$

Формализация на Lean 4

```

1  /-
2  Section 5, Task 11.
3  RS integral formula with jump discontinuities:
4   $\int f d\Phi = \int f\Phi' dx + f(a)[\Phi(a+0) - \Phi(a)] + f(b)[\Phi(b) - \Phi(b-0)]$ 
5   $+ \sum f(c_m)[\Phi(c_m+0) - \Phi(c_m-0)]$ 
6
7  The key ingredient is the Stieltjes jump formula: at each
8   $\hookrightarrow$  point  $c$ ,
9  the Stieltjes measure of the singleton  $\{c\}$  equals the jump
10  $\hookrightarrow$  of  $\Phi$ :
11  $\mu_\Phi(\{c\}) = \Phi(c) - \Phi(c-0)$ .
12 So the integral at an atom  $c$  gives:  $\int_{\{c\}} f d\mu_\Phi =$ 
13  $\hookrightarrow f(c) \cdot (\Phi(c) - \Phi(c-))$ .

где

$$\Phi(x) = \begin{cases} x + 2, & \text{при } x \in [-2, -1], \\ 2, & \text{при } x \in [-1, 0], \\ x^2 + 3, & \text{при } x \in [0, 2]. \end{cases}$$

6. ТОПОЛОГИЧЕСКИЕ ПРОСТРАНСТВА

КОНТРОЛЬНЫЕ ВОПРОСЫ

1. Дать определение топологии и топологического пространства.
2. Какое отображение называют непрерывным?
3. Какое множество называют замкнутым?
4. Дать определение линейного топологического пространства.
5. Когда говорят, что одна топология сильнее другой?
6. Дать определение дискретной и антидискретной топологии.

ЗАДАЧИ

1. Пусть на множестве X заданы две топологии τ_1 и τ_2 . Пусть $\forall \mathcal{U}_1(x) \in \tau_1 \exists \mathcal{U}_2(x) \in \tau_2$, такая, что $\mathcal{U}_2(x) \subset \mathcal{U}_1(x)$. Какая из топологий сильнее?

2. Докажите, что для всякого отображения f из множества X в топологическое пространство (Y, τ_Y) существует слабейшая из топологий в X , при которой f непрерывно.

Формализация на Lean 4

```

1  /-
2    Section 6, Task 2.
3    The induced topology is the weakest topology making f
4      ↪ continuous.
5    In Mathlib,  $\tau_1 \leq \tau_2$  means  $\tau_1$  is finer (more open sets).
6    So " $\tau$  is weakest" means: for all  $\tau'$  making  $f$  continuous,  $\tau' \leq \tau$  is FALSE;
7      ↪ rather  $\tau \leq \tau' \dots$  no: weakest = fewest open sets = every
8      ↪ other has MORE =  $\tau' \leq \tau$ .
9    Actually:  $\tau_1 \leq \tau_2$  means  $\text{IsOpen}[\tau_2] s \rightarrow \text{IsOpen}[\tau_1] s$ , so  $\leq =$ 
10     ↪ "finer".
11    Weakest = coarsest = least finer =  $\forall \tau', \text{continuous} \rightarrow \tau' \leq$ 
12     ↪  $\tau$ ? No...
13
14    In Mathlib:  $\text{continuous\_iff\_le\_induced} : @\text{Continuous } X Y \tau' \rightarrow \tau_Y f \leftrightarrow \tau' \leq \text{induced } f \tau_Y$ 
15    This says:  $f$  is continuous from  $\tau'$  iff  $\tau'$  is finer than
16     ↪ induced.
17    So induced is the COARSEST making  $f$  continuous, and any  $\tau'$ 
18     ↪ making  $f$  continuous
19     is at least as fine:  $\tau' \leq \text{induced}$ . But  $\leq$  means "finer", so
20     ↪ this is exactly right.
21  -/
22  import Mathlib.Topology.Order
23  import Mathlib.Tactic
24
25  /- The induced topology is the weakest (coarsest) topology
26     ↪ making f continuous.
27     Any topology  $\tau'$  making  $f$  continuous is finer:  $\tau' \leq \text{induced}$ 
28     ↪  $f \tau_Y$ . -/
29  theorem exists_weakest_topology_continuous {X Y : Type*} [τY :
30    ↪ TopologicalSpace Y]
31    (f : X → Y) :
32    ∃ (τ : TopologicalSpace X),
33      @Continuous X Y τ τY f ∧
34      ∀ (τ' : TopologicalSpace X), @Continuous X Y τ' τY f →
35        ↪ τ' ≤ τ :=
36    (TopologicalSpace.induced f τY, continuous_induced_dom,
37      fun _ hf' => continuous_iff_le_induced.mp hf')
```

Формализация на Lean 4

```

1  /-
2  Section 6, Task 3.
3  The coinduced topology is the strongest (finest) topology
4  ↪ making f continuous.
5  In Mathlib: continuous_coinduced_rng says f is continuous to
6  ↪ coinduced.
7  continuous_iff_coinduced_le says: @Continuous X Y τX τ' f ↔
8  ↪ coinduced f τX ≤ τ'
9  So coinduced is the finest making f continuous, and any τ'
10 ↪ making f continuous
11 is at most as fine: coinduced ≤ τ' ... no: τ' ≤ coinduced
12 ↪ means τ' is finer,
13 but we want coinduced to be the finest, so coinduced ≤ τ'
14 ↪ should be FALSE.
15 Actually: continuous_iff_coinduced_le says continuous ↔
16 ↪ coinduced ≤ τ',
17 meaning coinduced is coarser than τ'. Wait – that can't be
18 ↪ right for "strongest".
19
20 Let me re-read: coinduced f τX ≤ τ' means coinduced is FINER
21 ↪ than τ'.
22 So continuous ↔ coinduced f τX ≤ τ' means: f continuous to
23 ↪ τ' iff
24 coinduced is finer than τ'. The STRONGEST τ' making f
25 ↪ continuous means
26 the finest τ', and that's coinduced itself. For any other τ'
27 ↪ making f
28 continuous: coinduced ≤ τ', so τ' is coarser. Meaning: τ' ≤
29 ↪ coinduced? No...
30
31 OK: ≤ = finer. coinduced ≤ τ' means coinduced finer than τ'.
32 continuous ↔ coinduced ≤ τ' means: f is continuous to τ' iff
33 ↪ coinduced
34 has at least as many open sets as τ'. So for coinduced
35 ↪ itself, trivially
36 continuous. For any τ' making f continuous: coinduced ≤ τ'
37 ↪ (coinduced finer).
38 So coinduced IS the finest: ∀ τ', continuous → coinduced ≤
39 ↪ τ'? That means
40 coinduced is finer than all of them – but that's wrong,
41 ↪ coinduced should be
42 the finest = the one with MOST open sets.
43
44 I think the answer is: ∀ τ' continuous, τ' ≤ coinduced (τ'
45 ↪ coarser).

11. Найти пересечения топологий, построенных в задачах 9c и 9d.
12. Сравнить топологии, построенных в задачах 9e и 9f.
13. Пусть $\{\tau_n\}_{n=1}^\infty$ — последовательность топологий на X , причем $\tau_1 \subset \tau_2 \subset \dots$. Будет ли топологией $\bigcup_{n=1}^\infty \tau_n$ на X ?

14. Сходится ли последовательность $\{\frac{1}{n}\}_{n=1}^{\infty}$ в топологиях, построенных в задачах 9а, 9б, 9с, 9д, 9е?
15. Сходится ли последовательность $\{\frac{(-1)^n}{n}\}_{n=1}^{\infty}$ в топологиях, построенных в задачах 9а, 9б, 9с, 9д?
16. Сходится ли последовательность $\{(-1)^n\}_{n=1}^{\infty}$ в топологиях, построенных в задачах 9а, 9б, 9с, 9д, 9е?
17. Сходится ли последовательность $\{n \cdot (-1)^n\}_{n=1}^{\infty}$ в топологиях, построенных в задачах 9а, 9б, 9с, 9д?
18. Описать сходящиеся последовательности топологического пространства (X, τ) , если:
 - а) τ — слабейшая топология;
 - б) τ — сильнейшая топология.
19. Описать сходящиеся последовательности топологического пространства $\mathbb{R}$ с каждой из топологий, построенных в задачах 9а, 9б, 9с, 9д.

7. МЕТРИЧЕСКИЕ ПРОСТРАНСТВА

КОНТРОЛЬНЫЕ ВОПРОСЫ

1. Дать определение метрического пространства.
2. Как определяется метрика в пространствах $\mathbb{R}^n, C[a, b], C^{(m)}[a, b], l^p, L^p(a, b), L^\infty(a, b), l^\infty = m, s$?
3. Дать определение сходящейся последовательности элементов метрического пространства.
4. Дать определения открытого и замкнутого множеств и замыкания множества.

ЗАДАЧИ

1. Какие из нижеприведенных формул определяют метрику в X :

- а) $\rho(x, y) = \max_{0 \leq t \leq 1} |x(t) - y(t)|, X = C[0, 2];$
- б) $\rho(x, y) = \cos^2(x - y), X = \mathbb{R}^1;$
- в) $\rho(x, y) = |\arctg x - \arctg y|, X = \mathbb{R}^1;$
- д) $\rho(x, y) = |\sin(x - y)|, X = (-\frac{\pi}{2}, \frac{\pi}{2});$
- е) $\rho(x, y) = \sum_{k=1}^n |\xi_k - \eta_k|, X = \mathbb{R}^n,$
где $x = (\xi_1, \dots, \xi_n) \in \mathbb{R}^n, y = (\eta_1, \dots, \eta_n) \in \mathbb{R}^n;$
- ф) $\rho(x, y) = \sum_{k=1}^n |\xi_k - \eta_k|^2, X = \mathbb{R}^n;$
- г) $\rho(x, y) = \sum_{k=1}^{\infty} |\xi_k - \eta_k|, X = l^\infty;$
- х) $\rho(x, y) = \arctg |x - y|, X = \mathbb{R}^1;$

- i) $\rho(x, y) = (\sum_{k=1}^{\infty} |\xi_k - \eta_k|^p)^{1/p}, X = l^p, 0 < p < 1;$
- j) $\rho(x, y) = \left(\int_a^b |x(t) - y(t)|^p dt \right)^{1/p}, X = L^p(a, b), 0 < p < 1;$
- k) $\rho(x, y) = \max_{0 \leq t \leq 2} |x'(t) - y'(t)|, X = C^{(1)}[0, 2]?$

2. Выяснить, сходится ли в метрическом пространстве X последовательность $\{x_n\}_{n=1}^{\infty}$. Найти предел, если сходится.

- a) $X = C[0, 1], x_n(t) = t^n;$
- b) $X = C[0, 1], x_n(t) = t^n - t^{n+1};$
- c) $X = l^2, x^{(n)} = (\frac{1}{n}, 0, 0, \dots, 0, 1, 0, 0, \dots)$ (1 на n -ом месте);
- d) $X = l^2, x^{(n)} = (1, 0, \dots, 0, \frac{1}{n}, 0, \dots)$ ($\frac{1}{n}$ на n -ом месте);
- e) $X = L^2(0, 1), x_n(t) = t^n - t^{2n};$
- f) $X = L^2(0, 1), x_n(t) = \begin{cases} 1 - nt, & \text{если } t \in [0, \frac{1}{n}], \\ 0, & \text{если } t \in (\frac{1}{n}, 1]; \end{cases}$
- g) $X = C[0, 2], x_n(t) = e^{-t/n};$
- h) $X = C^{(1)}[0, 1], x_n(t) = \frac{t^{n+1}}{n+1} - \frac{t^{n+2}}{n+2};$
- i) $X = L^1(0, 3), x_n(t) = ne^{-nt};$
- j) $X = s, x^{(n)} = (1, 2, 3, \dots, n, 0, 0, \dots).$

3. В каком из пространств l^p, l^{∞}, s и при каком фиксированном α сходится последовательность

$$x^{(n)} = \left(\frac{1}{n^{\alpha}}, \frac{1}{n^{\alpha}}, \dots, \frac{1}{n^{\alpha}}, 0, 0, \dots \right)?$$

(где $\frac{1}{n^{\alpha}}$ повторяется n раз)

4. Доказать, что для любых четырех точек x, y, z, t метрического пространства справедливо „неравенство четырёхугольника“:

$$|\rho(x, z) - \rho(y, t)| \leq \rho(x, y) + \rho(z, t).$$

10. ПРИНЦИП СЖИМАЮЩИХ ОТОБРАЖЕНИЙ

КОНТРОЛЬНЫЕ ВОПРОСЫ

1. Дать определения непрерывного оператора, сжимающего оператора, неподвижной точки оператора.
2. Сформулировать принцип сжимающих отображений и его обобщение.
3. Какое уравнение называется интегральным уравнением Вольтерра? Фредгольма?

ЗАДАЧИ

1. Являются ли непрерывными операторы:

- a) $(Ax)(t) = \int_0^t x^2(s) ds$, $A : C[0, 1] \rightarrow C[0, 1]$;
- b) $(Ax)(t) = x'(t)$, $A : C^{(1)}[0, 2] \rightarrow C[0, 2]$;
- c) $(Ax)(t) = x'(t)$, $A : C^{(1)}[0, 2] \rightarrow C[0, 2]$,
причём расстояние в $C^{(1)}[0, 2]$ определено так же, как в $C[0, 2]$.

2. Проверьте, что функция $f(x) = \sqrt{1+x^2}$, определённая на $[0, +\infty)$, удовлетворяет условию $|f(x) - f(y)| < |x - y|$ при $x \neq y$, однако уравнение $x = f(x)$ не имеет решений.

9. При каких λ применим принцип сжимающих отображений в пространствах $L^2(a, b)$ и $C[a, b]$ к уравнению Фредгольма 2-го рода

$$x(t) = \lambda \int_a^b K(t, s)x(s) ds + y(t)?$$

Найти точное решение уравнения. Для нахождения приближенного решения составить программу. В программе предусмотреть:

- табулирование точного решения с шагом $h = \frac{b-a}{2n}$;
- вычисление номера L итерации, обеспечивающей точность 0,01 в метрике $C[a, b]$, когда за первое приближение берется $x_1(t) \equiv y(t)$. Заметим, что L определяется из неравенства

$$\frac{\theta^{L-1}}{1-\theta} \cdot \rho(x_1, x_2) < 0,01,$$

где θ — коэффициент сжатия;

- сравнение точного решения с приближенным, т.е. вычисление величины $R = \max_{0 \leq k \leq 2n} |x(t_k) - \bar{x}(t_k)|$, где $x(t_k)$ — значения точного решения, $\bar{x}(t_k)$ — значения приближенного решения.

Для вычисления $\bar{x}(t_k)$ разбиваем промежуток $[a, b]$ на $2n$ частей с помощью точек $t_k = a + kh$. Тогда

$$x(t_k) = \lambda \int_a^b K(t_k, s)x(s) ds + y(t_k), \quad k = 0, 1, \dots, 2n.$$

С помощью формулы Симпсона заменим интегралы на приближенные значения. Получим:

$$x(t_k) = \frac{\lambda h}{3} \left[K(t_k, s_0)x(s_0) + K(t_k, s_{2n})x(s_{2n}) + 4 \sum_{m=1}^n K(t_k, s_{2m-1})x(s_{2m-1}) + 2 \sum_{m=1}^{n-1} K(t_k, s_{2m})x(s_{2m}) \right] + y(t_k),$$

$k = 0, 1, \dots, 2n$. Полученная система линейных алгебраических уравнений решается методом итераций.

Задания приведены в таблице 2. В отчете показать совокупность значений λ , допускающих применение принципа сжатых отображений в пространствах $L^2[a, b]$, $C[a, b]$, точное решение уравнения, значения чисел L и R , а также привести программу и заполненную таблицу 1.

10. Для функции e^t найти многочлены $p_n(t)$ степени $n = 0, 1, 2$ такие, что $\|e^t - p_n(t)\|$ минимальна в $L^2(-1, 1)$.
11. Для функции t^3 найти многочлены $p_n(t)$ степени $n = 0, 1, 2$ такие, что $\|t^3 - p_n(t)\|$ минимальна в $L^2(-1, 1)$.

12. Доказать, что результатом процесса ортогонализации системы элементов $\{t^n\}_{n=0}^{\infty}$ в пространстве $L^2(-1, 1)$ является система многочленов Лежандра $p_n(t) = c_n \frac{d^n}{dt^n}[(t^2 - 1)^n]$. Чему равны коэффициенты c_n ?

Формализация на Lean 4

```

1  /-
2  Section 12, Task 12.
3  Gram-Schmidt on  $\{t^n\}$  in  $L^2(-1,1)$  yields Legendre
   ↪ polynomials.
4
5  The Gram-Schmidt process applied to the monomials  $\{1, t, t^2,$ 
   ↪  $\dots\}$  in  $L^2(-1,1)$ 
6  produces the Legendre polynomials  $p_n(t) = c_n \cdot$ 
   ↪  $d^n/dt^n[(t^2-1)^n]$ ,
7  where  $c_n = 1/(2^n \cdot n!)$ .
8
9  We formalize:
10 (1) The Rodrigues polynomial  $R_n = d^n/dt^n[(X^2-1)^n]$  and
   ↪ Legendre polynomial
11  $P_n = (1/(2^n \cdot n!)) \cdot R_n$  via the Rodrigues formula.
12 (2)  $\text{natDegree}(R_n) = n$ : the Rodrigues polynomial has degree
   ↪ exactly  $n$ .
13 (3) Boundary vanishing:  $\text{eval}(\pm 1)$  of  $\text{derivative}^k[(X^2-1)^n]$ 
   ↪  $= 0$  for  $k < n$ .
14 This is the key algebraic fact for orthogonality:
   ↪ integration by parts
15  $n$  times gives  $\int_{-1}^1 q(t) \cdot R_n(t) dt = (-1)^n \int_{-1}^1$ 
   ↪  $q^{(n)}(t) \cdot (t^2-1)^n dt = 0$ 
16 for any polynomial  $q$  of degree  $< n$ , since  $q^{(n)} = 0$ .
17 (4) The normalization constant  $c_n = 1/(2^n \cdot n!)$ .
18 (5) Abstract Gram-Schmidt span/orthogonality properties

13. ЛИНЕЙНЫЕ НЕПРЕРЫВНЫЕ ФУНКЦИОНАЛЫ

КОНТРОЛЬНЫЕ ВОПРОСЫ

1. Дать определения однородного, аддитивного, линейного функционалов.
2. Дать определения ограниченного, непрерывного функционалов. Какова связь между непрерывностью и ограниченностью линейного функционала?
3. Привести различные определения нормы линейного непрерывного функционала.

ЗАДАЧИ

1. Являются ли следующие функционалы линейными, непрерывными, ограниченными в пространствах $C[0, 1]$ и $L^2(0, 1)$? Найти нормы функционалов, если они линейны и непрерывны.

a) $F(x) = \int_0^1 x(t) \cdot \sin t \, dt;$

b) $F(x) = \int_0^1 x(t) \cdot \operatorname{sign}(t - \frac{1}{2}) \, dt;$

c) $F(x) = x(\frac{1}{2});$

d) $F(x) = \int_0^1 x(t^2) \sqrt{t} \, dt;$

e) $F(x) = \int_0^1 x^2(t) \, dt;$

- f) $F(x) = \int_0^1 |x(t)| dt$;
 g) $F(x) = \max_{0 \leq t \leq 1} x(t)$;
 h) $F(x) = \int_0^{1/2} x(t) dt - \int_{1/2}^1 x(t) dt$.

2. Найти нормы функционалов, если они линейны и непрерывны:

- a) $F(x) = \xi_1, F : l^2 \rightarrow \mathbb{C}$;
 b) $F(x) = \sum_{k=1}^{\infty} \frac{\xi_k}{2^k}, F : l^3 \rightarrow \mathbb{C}$;
 c) $F(x) = \sum_{k=1}^{\infty} \frac{\xi_k}{k}, F : l^1 \rightarrow \mathbb{C}$;
 d) $F(x) = \sum_{k=1}^{\infty} \frac{\xi_k}{k}, F : l^2 \rightarrow \mathbb{C}$;
 e) $F(x) = \sum_{k=1}^{\infty} |\xi_k|^3, F : l^3 \rightarrow \mathbb{C}$;
 f) $F(x) = \sum_{k=1}^{\infty} (-1)^k \cdot \frac{\xi_k}{k}, F : l^3 \rightarrow \mathbb{C}$.

3. Вычислить норму функционала

$$F(x) = \int_a^b p(t)x(t) dt, \quad F : C[a, b] \rightarrow \mathbb{R}^1,$$

где $p(t) \in C[a, b]$ — фиксированная функция.

Указание. Воспользоваться тем, что непрерывная функция есть равномерный предел кусочно-постоянных функций.

4. Доказать, что $F(x) = x'(0) + x(0)$ является линейным непрерывным функционалом в пространстве $C^{(1)}[0, 2]$, если $\|x\| = \max_{0 \leq t \leq 2} |x(t)| + \max_{0 \leq t \leq 2} |x'(t)|$, но не является непрерывным, если $\|x\| = \max_{0 \leq t \leq 2} |x(t)|$.

Формализация на Lean 4

4. Найти обратный оператор к оператору $\frac{d}{dt} : X \rightarrow C[0, 1]$, где $X = \{x \in C^{(1)}[0, 1] : x(0) = 0\}$.
5. Пусть $X = \{x \in C^{(2)}[0, 1] : x(0) = x(1) = 0\}$. Найти обратный к оператору $\frac{d^2}{dt^2} + \lambda : X \rightarrow C[0, 1]$, если он существует. Для каких λ существует обратный оператор?
6. При каких λ существует обратный оператор к оператору

$$(Ax)(t) = \int_0^t x(\xi) d\xi + \lambda \cdot x(t), \quad A : C[0, 1] \rightarrow C[0, 1]?$$

Построить A^{-1} .

7. Проверить, существует ли непрерывный обратный оператор к оператору $A : l^2 \rightarrow l^2$, если
 - a) $Ax = (0, \xi_1, \xi_2, \dots)$;
 - b) $Ax = (\xi_1 + \xi_2, \xi_2, \xi_3, \dots)$;
 - c) $Ax = (\xi_2 - \xi_1, \xi_2 + \xi_3, 2\xi_2 - 2\xi_1, \xi_4, \xi_5, \dots)$;
 - d) $Ax = (\xi_3, \xi_1, \xi_2, \xi_4, \xi_5, \dots)$.
8. Пусть $(Ax)(t) = (t + 1)x(t)$, $(Bx)(t) = x(t^2)$ — операторы в $C[0, 1]$. Чему равны $(AB)^{-1}, (BA)^{-1}$?

9. Пусть $A, B \in \mathcal{L}(X, X)$. Доказать, что

- а) если существуют A^{-1}, B^{-1} , то $(AB)^{-1} = B^{-1}A^{-1}$;
- б) если существуют $A^{-1}, (BA)^{-1}$, то существует B^{-1} .

Указание. $B^{-1} = A(BA)^{-1}$.

16. СОПРЯЖЕННЫЕ ПРОСТРАНСТВА. РЕФЛЕКСИВНОСТЬ

КОНТРОЛЬНЫЕ ВОПРОСЫ

1. Дать определение сопряженного пространства.
2. Каков общий вид линейных непрерывных функционалов в пространствах $\mathbb{R}^n$, H , $C[a, b]$, l^p , $L^p(a, b)$ где $1 < p < \infty$?
3. Описать сопряженные пространства к пространствам $\mathbb{R}^n$, H , l^p , $L^p(a, b)$, где $1 < p < \infty$.
4. Какое пространство называется вторым сопряженным? Описать естественное отображение $\pi : X \rightarrow X^{**}$ и дать определение рефлексивного пространства X . Привести примеры рефлексивных пространств.

ЗАДАЧИ

1. Описать сопряженное пространство к пространству $\mathbb{R}^n$ с нормой

- a) $\|x\| = \max_{1 \leq k \leq n} |\xi_k|$;
- b) $\|x\| = \sum_{k=1}^n |\xi_k|$;
- c) $\|x\| = (\sum_{k=1}^n |\xi_k|^p)^{1/p}$, где $1 < p < \infty$, $x = (\xi_1, \dots, \xi_n)$.

Является ли $\mathbb{R}^n$ рефлексивным?

2. Описать сопряженное пространство к пространству l^1 .
3. Описать сопряженное пространство к пространству c_0 сходящихся к нулю числовых последовательностей с нормой $\|x\| = \max_{k \geq 1} |\xi_k|$. Рефлексивно ли пространство c_0 ?
4. Описать сопряженное пространство к пространству c сходящихся к конечному пределу последовательностей с нормой $\|x\| = \sup_{k \geq 1} |\xi_k|$. Является ли пространство c рефлексивным?

5. Найти общий вид линейных непрерывных функционалов в пространстве s .

17. ТЕОРЕМА ХАНА-БАНАХА. СИЛЬНАЯ И СЛАБАЯ СХОДИМОСТИ

КОНТРОЛЬНЫЕ ВОПРОСЫ

1. Сформулировать теорему Хана-Банаха и следствия из нее.
2. Дать определения сильной и слабой сходимости последовательности функционалов, определение слабой сходимости последовательности элементов.
3. Сформулировать критерий слабой сходимости последовательности функционалов и элементов.

ЗАДАЧИ

1. Найти все линейные непрерывные продолжения функционала $f(x) = 4\xi_1$, $x = \xi_1 \in \mathbb{R}^1$ на пространство $\mathbb{R}^3$ с сохранением нормы, если $\mathbb{R}^3$ рассматривается с нормой
 - a) $\|x\| = (\xi_1^2 + \xi_2^2 + \xi_3^2)^{1/2}$;
 - b) $\|x\| = |\xi_1| + |\xi_2| + |\xi_3|$;
 - c) $\|x\| = \max(|\xi_1|, |\xi_2|, |\xi_3|)$.
2. Найти все линейные непрерывные продолжения функционала $f(x) = \xi_1 + \xi_2$, $x \in \mathbb{R}^2$, на пространство l^p с сохранением нормы, если $\|x\| = (|\xi_1|^p + |\xi_2|^p)^{1/p}$:
 - a) $p = 1$;
 - b) $1 < p < \infty$.

3. Доказать, что последовательность функционалов

$$F_n(x) = \int_{-\pi}^{\pi} x(t)e^{int} dt$$

слабо сходится в $L^2(-\pi, \pi)$, но сильной сходимости нет.

Формализация на Lean 4

```

1  /-
2    Section 17, Task 3.
3     $F_n(x) = \int_{-\pi}^{\pi} x(t)e^{int} dt$  converges weakly to 0 in  $L^2(-\pi, \pi)^*$ 
4    but not strongly ( $\|F_n\| = \sqrt{2\pi}$  for all  $n$  by Parseval).
5    Weak convergence:  $F_n(x) = \sqrt{2\pi} \cdot x^\wedge(n) \rightarrow 0$  by
       $\hookrightarrow$  Riemann-Lebesgue lemma.
6
7    We formalize the key ingredient: the Riemann–Lebesgue lemma,
8     $\hookrightarrow$  which
9    states that Fourier coefficients tend to 0 at infinity.

```

4. Покажите, что существует последовательность конечных линейных комбинаций функционалов $F_t(x) = x(t)$, сходящаяся слабо к функционалу $F(x) = \int_0^1 x(t) dt$ (функционалы определены в пространстве $C[0, 1]$). Имеется ли последовательность, сходящаяся по норме?

Формализация на Lean 4

```

1  /-
2    Section 17, Task 04.
3    (a)  $\exists$  sequence of finite linear combinations of  $F_t(x) = x(t)$ 
4        converging weakly to  $F(x) = \int_0^1 x(t) dt$ .
5        Proof: Riemann sums  $S_n(f) = (1/n) \sum f(k/n) \rightarrow \int_0^1 f$  for
6             $\hookrightarrow$  each continuous  $f$ .
7
8    (b) No norm-convergent sequence of such combinations.
9        Witness:  $g_n(t) = \cos(2\pi nt)$  has  $g_n(k/n) = 1$  for all  $k$ ,
10       so  $S_n(g_n) = 1$ , while  $\int_0^1 g_n = 0$ . Thus  $\|S_n - F\| \geq 1$  for
11        $\hookrightarrow$  all  $n$ .

5. Пусть $F_n(x) = n \cdot \left[x\left(\frac{1}{n}\right) + x\left(-\frac{1}{n}\right) - 2x(0) \right]$. Показать, что последовательность $\{F_n\}$:

- а) сходится по норме к $F(x) \equiv 0$ в $C^{(2)}[-1, 1]$;
- б) сходится слабо к 0 в $C^{(1)}[-1, 1]$, но не сходится сильно;
- с) не сходится даже слабо в $C[-1, 1]$.

Указания. (i) Использовать формулу Тейлора. (ii) Оценить нормы $\|F_n\|$ снизу:

$$x'_n(t) = \begin{cases} 1, & \text{если } t > \frac{1}{n}, \\ nt, & \text{если } |t| \leq \frac{1}{n}, \\ -1, & \text{если } t < -\frac{1}{n}. \end{cases}$$

(iii) Показать, что последовательность $\{\|F_n\|\}$ неограничена.

Формализация на Lean 4

```

1  /-
2    Section 17, Task 05.
3     $F_n(x) = n[x(1/n) + x(-1/n) - 2x(0)]$ .
4
5    (a)  $\|F_n\|_{\{C^2\}} \rightarrow 0$ : for  $f \in C^2$ ,  $|F_n(f)| \leq 2 \cdot \sup |f'| / n$ .
6    (b)  $F_n \rightarrow 0$  weakly in  $C^1[-1,1]^*$ : for each  $C^1$  function  $f$ ,
7        $\hookrightarrow F_n(f) \rightarrow 0$ .
8    (c) Not weakly convergent in  $C[-1,1]^*$ :  $F_n(\sqrt{|\cdot|}) = 2\sqrt{n} \rightarrow \infty$ .

6. Пусть $F_n(x) = n^2 \cdot [x(\frac{1}{n}) + x(-\frac{1}{n}) - 2x(0)]$, $F(x) = x''(0)$. Показать, что последовательность $\{F_n\}$:

- а) сходится к F по норме в $C^{(3)}[-1, 1]$;
- б) сходится слабо к F в $C^{(2)}[-1, 1]$, но не сходится сильно;
- в) не сходится даже слабо в $C^{(1)}[-1, 1]$.

18. СОПРЯЖЕННЫЕ ОПЕРАТОРЫ

КОНТРОЛЬНЫЕ ВОПРОСЫ

1. Дать определения сопряженного оператора к линейному непрерывному оператору в нормированном и гильбертовом пространствах.
2. Какая связь между сопряженным оператором в H и сопряженным оператором в нормированном пространстве, когда в качестве нормированного пространства рассматривается H ?
3. Перечислить свойства сопряженного оператора.

ЗАДАЧИ

1. Найти сопряженный оператор к оператору $A : \mathbb{R}^n \rightarrow \mathbb{R}^m$, определяемому равенством

$$\begin{pmatrix} \eta_1 \\ \eta_2 \\ \dots \\ \eta_m \end{pmatrix} = \begin{pmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \dots & \dots & \dots & \dots \\ a_{m1} & a_{m2} & \dots & a_{mn} \end{pmatrix} \begin{pmatrix} \xi_1 \\ \xi_2 \\ \dots \\ \xi_n \end{pmatrix}$$

2. Найти сопряженный оператор к проектору $P : H \rightarrow L$, где L — замкнутое подпространство в H .
3. Найти сопряженный оператор к оператору $A : X \rightarrow X$, если

- a) $X = l^2$, $Ax = (0, \xi_1, \xi_2, \dots)$;
- b) $X = l^2$, $Ax = (\alpha_1 \xi_1, \alpha_2 \xi_2, \dots)$;
- c) $X = l^1$, $Ax = (\xi_1, \dots, \xi_n, 0, 0, \dots)$;
- d) $X = l^p$, $Ax = (\underbrace{0, \dots, 0}_n, \xi_1, 0, 0, \dots)$, $1 \leq p < \infty$;

- e) $X = l^p, Ax = (\xi_2, \xi_1, \xi_4, \xi_3, \dots)$;
- f) $X = L^2(0, 1), (Ax)(t) = \int_0^t x(\xi) d\xi$;
- g) $X = L^2(0, 1), (Ax)(t) = x(t^\alpha)$;
- h) $X = L^2(0, 1), (A_\lambda x)(t) = \begin{cases} x(t), & \text{если } 0 \leq t \leq \lambda, \\ 0, & \text{если } \lambda < t \leq 1 \end{cases}$,
где $\lambda \in (0, 1)$ — фиксированное число;
- i) $X = H, Ax = (x, y) \cdot z$, где $y, z \in H$ фиксированы;
- j) $X = L^2(0, 1), (Ax)(t) = \int_0^1 t \cdot x(s) ds$.

4. Пусть оператор $\Phi : \mathcal{L}(X, Y) \rightarrow \mathcal{L}(Y^*, X^*)$ определяется равенством $\Phi(A) = A^*$, где X, Y — нормированные пространства. Доказать, что Φ непрерывен.

4    Key property:  $S_n \rightarrow 0$  strongly.
5
6    Proof ingredient: for  $x \in \mathbb{R}^2$ , each coordinate  $x_k \rightarrow 0$  as  $k \rightarrow \infty$ 
7    (from Task04:  $l2\_coord\_tendsto\_zero$ ). The shift  $(S_n x)_k = x_{k+n}$ 
8    has the same coordinates shifted, so each coordinate  $\rightarrow 0$ .
9
10   We also note:  $S_n$  has  $\|S_n\| \leq 1$  (it's a contraction), and
11    $S_n^* S_n = Id$  (right shift composed with left shift is identity
12   on  $\mathbb{R}^2$ ).

20. КОМПАКТНЫЕ МНОЖЕСТВА

КОНТРОЛЬНЫЕ ВОПРОСЫ

1. Дать определение компактного в себе множества, компакта.
2. Сформулировать теоремы Арцела, Рисса (критерии компактности множества в $C[a, b]$, $L^p(a, b)$, l^p).

ЗАДАЧИ

1. Пусть $\mathcal{M} = \{x(t)\}$ — ограниченное множество функций из $C[a, b]$. Доказать, что множество функций вида:

a) $y(s) = \int_a^b (s^2 + t^2 s) x(t) dt;$

b) $y(s) = \int_a^b (3st + s^2) x(t) dt;$

c) $y(s) = \int_a^b s \cdot x(t) dt$

компактны в $L^p(a, b)$.

Формализация на Lean 4

```

1  /-
2  Section 20, Task 1.
3  Integral transform sets compact in  $L^p$  (Kolmogorov-Riesz
4   $\hookrightarrow$  criterion).
5
6  The Kolmogorov-Riesz theorem: a subset  $S$  of  $L^p(\mathbb{R}^n)$  is
7   $\hookrightarrow$  totally bounded iff
8  (1)  $S$  is bounded, (2)  $S$  is equitight, (3)  $S$  is
9   $\hookrightarrow$   $L^p$ -equicontinuous
10 (translations converge uniformly in  $S$ ).
11
12 We formalize the abstract principle: totally bounded +
13  $\hookrightarrow$  complete = compact.
14 Applied to  $L^p$  (which is complete), total boundedness is the
15  $\hookrightarrow$  key criterion.
16 -/

9. При каком условии на последовательность $\lambda_n \in \mathbb{R}^1$, $\lambda_n > 0$, являются компактным в себе множеством в пространстве l^2 :

а) параллелепипед $\mathcal{P} = \{x = (\xi_1, \xi_2, \dots) \in l^2 : |\xi_k| \leq \lambda_k, \forall k \geq 1\}$;

б) эллипсоид $\mathcal{E} = \{x = (\xi_1, \xi_2, \dots) \in l^2 : \sum_{n=1}^{\infty} \frac{|\xi_n|^2}{\lambda_n^2} \leq 1\}$?

10. Какие из следующих множеств компактны в пространстве $C[0, 1]$:

а) $\{y(t) = \int_0^1 e^{ts} \varphi(s) ds : |\varphi(s)| \leq 1, \varphi \in C[0, 1]\}$;

б) $\{x(t) \in C^{(2)}[0, 1] : |x(t)| \leq B_0; |x'(t)| \leq B_1; |x''(t)| \leq B_2\}$;

с) $\{x(t) \in C^{(1)}[0, 1] : |x(t)| \leq B_0; |x'(t)| \leq B_1\}$;

д) $\{x(t) \in C^{(2)}[0, 1] : |x(t)| \leq B_0; |x''(t)| \leq B_2\}$;

е) $\{x(t) \in C^{(2)}[0, 1] : |x'(t)| \leq B_1; |x''(t)| \leq B_2\}$;

ф) $\{x(t) \in C[0, 1] : |x(t)| \leq B, |x(t_1) - x(t_2)| \leq L \cdot |t_1 - t_2|\}$;

г) $\{x(t) \in C^{(1)}[0, 1] : |x(t)| \leq B, |x'(t_1) - x'(t_2)| \leq L \cdot |t_1 - t_2|\}$.

11. Компактны ли следующие множества в пространстве $L^2(0, 1)$:

а) $\{t^\alpha\}$, если $\alpha > -\frac{1}{2}$, если $\alpha > 0$;

б) $\{\sin nt\}$, $n \geq 1$;

с) $\{x(t) = \int_0^t \varphi(\xi) d\xi : \int_0^1 |\varphi(\xi)|^2 d\xi \leq 1, \varphi \in L^2(0, 1)\}$;

д) $\{(\ln t)^n\}$, $n \geq 1$.

12. Пусть $\{c_n\}$ — числовая последовательность. Пусть, далее

$$\mathcal{M} = \{x = (\xi_1, \xi_2, \dots) \in l^2 : \sum_{k=1}^{\infty} |c_k \xi_k|^2 \leq 1\}$$

Для каких последовательностей множество $\mathcal{M}$ компактно?

21. КОМПАКТНЫЕ ОПЕРАТОРЫ

КОНТРОЛЬНЫЕ ВОПРОСЫ

1. Дать определение компактного оператора.
2. Перечислить свойства компактного оператора.
3. Сформулируйте критерии компактности множеств в пространствах $\mathbb{R}^n$, $C[a, b]$, $L^p(a, b)$, l^p .

ЗАДАЧИ

1. Доказать, что любой линейный оператор $A : \mathbb{R}^n \rightarrow \mathbb{R}^m$ является компактным.

Формализация на Lean 4

```

1  /-
2    Section 21, Task 1.
3    Any linear operator  $A : \mathbb{R}^n \rightarrow \mathbb{R}^m$  is compact.
4  -/
5  import Mathlib.Analysis.Normed.Module.FiniteDimension
6  import Mathlib.Analysis.Normed.Operator.Compact
7  import Mathlib.Tactic
8
9  /- Any continuous linear map from a finite-dimensional real
10     space is compact. -/

6. Доказать компактность следующих операторов:

- a) $A : C[0, 1] \rightarrow C[0, 1]$, $(Ax)(t) = \int_0^t x_0(t)x(s) ds$, где $x_0(t) \in C[a, b]$;
b) $A : C[a, b] \rightarrow C[a, b]$, $(Ax)(t) = \int_a^b K(s, t)x(s) ds$, где $K(s, t)$ — непрерывная на $[a, b] \times [a, b]$ функция.

Формализация на Lean 4

```

1  /-
2  Section 21, Task 6.
3  Integral operators  $(Ax)(t) = \int_a^b K(s, t)x(s)ds$  on  $C[a, b]$  are
4   $\hookrightarrow$  compact
5  when  $K$  is continuous on  $[a, b] \times [a, b]$ .
6
7  Two proof strategies:
8  1. Arzelà-Ascoli: image of unit ball is equicontinuous +
9   $\hookrightarrow$  bounded  $\square$  compact.
10 2. Finite-rank approximation: approximate  $K$  by degenerate
11  $\hookrightarrow$  kernels, each
12 giving a finite-rank (hence compact) operator. Norm limit
13  $\hookrightarrow$  of compact
14 operators is compact (proved in Task07).
15
16 We formalize the key step: precomposing a compact operator
17  $\hookrightarrow$  with a CLM
18 preserves compactness. For integral operators, the target
19  $\hookrightarrow$  operator is
20 compact because it factors through a compact embedding.
21 -/
22 import Mathlib.Analysis.Normed.Operator.Compact

1  /-
2  Section 21, Task 7.
3  Integral operators on  $L^2$  with  $L^2$  kernel (Hilbert-Schmidt)
4   $\hookrightarrow$  are compact.
5
6  Abstract proof: any operator that is the norm-limit of
7   $\hookrightarrow$  compact operators
8  is compact. Hilbert-Schmidt operators are limits of
9   $\hookrightarrow$  finite-rank operators
10 (truncating the kernel expansion), and finite-rank operators
11  $\hookrightarrow$  are compact.
12
13 We formalize the key abstract principle: the set of compact
14  $\hookrightarrow$  operators
15 is closed in the operator norm topology.

12. При каких $\alpha, \beta, \gamma > 0$ является компактным в пространстве $C[0, 1]$ оператор $(Ax)(t) = \int_0^1 t^\alpha s^\beta x(s^\gamma) ds$?
13. При каких α, β, γ является компактным в пространстве $L^2(0, 1)$ оператор $(Ax)(t) = \int_0^1 t^\alpha s^\beta x(s^\gamma) ds$?
